Among the most celebrated fairs in Europe are those of Frankfurt on the Main and Leipzig in Germany, of Nijmegen in Russia, and of Lyons in France. portunities for commercial transactions, and this origin is commemorated in the German word *messe*, which means both the mass and a fair (see *hermen*). See *market*.

Syn. 2. Faery, Elf, Fay, Sulph, Genie, Jinn, Gnome, Goblin. Faery is the most general name for a diminutive imaginary being, generally in human form, sometimes very benevolent or inclined to teach moral lessons, as the fairy godmother of Cinderella, sometimes malevolent in the extreme, as in many fairy stories. Spenser took up the word in Chaucer's spelling, *faerie* or *faery*, and gave it an extended meaning, which is now commonly confined to that spelling and to his poem, the personages in "The Faerie Queene" live in an unlocated region, essentially like the rest of the world, and are of heroic and occasionally supernatural powers, these personages he sometimes calls *elves* or *elms*. In ordinary use an elf differs from a fairy only in generally assuming young, and being more often mischievous. Pope, in "The Rape of the Lock," has given a definite cast to *elf* and *goblin*, these two words are elsewhere often associated, *gnomes* having always been fabled as living in underground abodes, and especially as being the guardians of mines and quarries, while *sulphs* are denizens of the air. From this difference of place it has followed that *gnomes* are generally thought of with repugnance or dread, and *sulphs*, although of both sexes in literature, are popularly thought of as young, slender, and graceful females; hence the expression "a sulph-like form." To Oriental imagination is due the *jinn*, *djinn*, or *djinn*; the form *genie* is most vividly associated with the "Arabian Nights," as the *genie* of Aladdin's lamp, the *genie* that the fisherman let out of the bottle. A *goblin* is wicked, mischievous, or at least roguish, and frightful or grotesque in appearance. See the definitions of *kobold*, *elf*, *brocken*, *banshee*, *sprite*, *javie*, *nicie*, *nymph*, etc.

Specifically—2. A false syllogism; an invalid argumentation; a proposed reasoning which, professing to deduce a necessary conclusion, reaches one which may be false though the premises are true, or which, professing to be probable, infers something that is really not probable, or wants the kind of probability assigned to it. A fallacy is either a *sophism* or a *paralogism*, according as the deceit is intentional or not. But the word *paralogism* is also used to signify a purely logical fallacy—that is, a formal fallacy, or a direct violation of the canons of syllogism. Logicians enumerate as many different kinds of formal fallacy as they give of canons of syllogism, from four to eight. See below.

No man was less likely to be imposed upon by *fallacies* in argument, or by exaggerated statements of fact.

Macaulay, Boswell's Johnson.

The lazy belief that in some unspecified way things will so adjust themselves as to prevent the natural consequences of a wrong or foolish act is a very common *fallacy*.

J. Fiske, Evolutionist, p. 221.

A fallacy is used to mean: (1) A piece of false reasoning, in the narrower sense, either an invalid immediate inference, or an invalid syllogism, a supposed equivalent term which is not equivalent, or a syllogism that breaks one of the rules. (2) A piece of false reasoning, in the wider sense, whereby from true facts a false conclusion is inferred. (3) A false belief, whether due to correct reasoning from untrue premises (reasons or sources) or to incorrect reasoning from true ones. (4) Any mental confusion whatever.

Fallacies in things, according to the old logicians, fallacies that are not in words. They are of seven kinds: (1) The fallacy of accident, arising when a syllogism is made to conclude that, because a given predicate may be truly affirmed of a given subject, the same predicate may be truly affirmed respecting all the accidents of that subject. (2) The fallacy of speech *relative* and *speech absolute*, occurring when a proposition is affirmed with a qualification or limitation in the premises, but virtually without the qualification in the conclusion. (3) The fallacy of irrelevant conclusion, or *ignoratio elenchis*, occurring when the disputant, professing to contradict the thesis, advances another proposition which contradicts it in appearance but not in reality. (4) The fallacy of the consequent, or *non sequitur*, an argument from consequent to antecedent, which may really be a good probable argument. (5) *Deceiving the question*, or the *petitio principii*, a syllogism, valid in itself, but in which that is affirmed as a premise which no man who doubts the conclusion would admit. (6) The fallacy of false cause, arising when, in making a deductive argument, besides the proposition to be refuted, some other false premise is introduced. (7) The fallacy of name *interconversion*, in which two or more questions are so proposed that they appear to be but one: as, "Have you lost your horse?" a question which implies that you had horses. **Fallacies of composition and division**, fallacies which arise when in the same syllogism words are employed at one time collectively, and at another distributively, so that what is true in one collection is not true in the other in separation, or the reverse.

Fallacy of accent, a fallacy arising from the mode of pronouncing a word. **Fallacy of amphibology**, a fallacy arising from the double construction of a sentence.

Fallacy of an illicit process, a false syllogism in which a term enters into the conclusion with a different distribution from what it had in the premise. — **Fallacy of equivocation**, a fallacy arising from the double meaning

of a word. — **Fallacy of figure of speech**, a fallacy arising from a tropic use of language. — **Fallacy of homonymy**, a fallacy arising from the double meaning of a single word. — **Fallacy of illicit particularity**, a syllogism in which the degree of particularity of the conclusion is different from the sum of those of the premises. See *particularity*. — **Fallacy of no middle**, a false syllogism in which the premises have no term in common that is dropped from the conclusion. — **Fallacy of undistributed middle**, a syllogism in which the middle term is undistributed in both premises; as, He who says that you are an animal speaks truly; he who says that you are a goose says that you are an animal, therefore, he who says that you are a goose speaks truly. — **Fallacy of unreal middle**, a fallacy which fails to assert the existence of any object of the kind denoted by the middle term; as, Pegasus was a horse, and Pegasus had wings; therefore, some horse has had wings. **Semilogical fallacy**, or **fallacy in words**, a fallacy which derives by some defect of language, and ceases to do so when the meaning of the propositions is strictly analyzed.

4. In the most general sense, those who descend from a common progenitor; a tribe or race; kindred; lineage. Thus, the Israelites were a branch of the *family* of Abraham, the whole human race constitutes the human *family*.

Hence—5. Any group or aggregation of things classed together as kindred or related from possessing in common characteristics which distinguish them from other things of the same order. Thus, a body of languages regarded as representatives of a common ancestor, or as having come by gradual processes of alteration and diversification from the same original tongue, is called a *family*, as the Indo-European *family*, the South African *family*.

Specifically—6. In scientific classifications, a group of individuals more comprehensive than a genus and less so than an order, based on fewer or less definite points of physical resemblance than the former, and on more or more definite ones than the latter. In zoology the name of a family now almost invariably ends in *-idae*, which has the force of a patronymic. The prime divisions of a family are termed *subfamilies*, and end usually in *-inae*. The prime associations of families are in some recent systems of classification called *superfamilies*, there is no obvious distinction, however, between these and suborders. The recognition and definition of the family, as of other zoological groups, is entirely a matter of expert opinion, having no natural necessity for being; hence the wide difference among zoologists in their evaluation of the term. A modern family is usually less comprehensive than a genus as used in the last century. The use of the regular termination *-idae* has done much to fix the valuation of the family more stably than that of either the genus or the order. Zoological families are considered as being approximately of the same grade in classification as the groups called orders in botany. Hence the word *family* is generally used by botanists as a synonym of order, as *order Ranunculaceae*, the crowfoot *family*. In cryptogamic botany the family is the prime division of the order or suborder, and the prime division of the family is the subfamily or tribe, but in some classifications the family is made to rank next below the tribe. The absolute rank of the family also varies with different authors, the family of one being the order of another, etc. The usual termination in *-ace* (or *-ea*), but *-aceae* (or *-acae*) is used as a family termination in some cases. See *classification*.

7. Course of descent; genealogy.

farm (färm), *n.* [*Early mod. E. also farme, ferme; < MF. ferme*, rent, revenue, particularly as collected by a 'farmer', factor, or steward, hence also stewardship; also a meal, a feast; *< AS. feorm* (feom, gen. acc. etc., *feorme*), provision, food, supplies; provisions, etc., supplied by a vassal or tenant to his lord, esp. to the king; hence an estate from which such supplies are due (*cyninges feorm*, late *AS. cynges feorme-ham*, 'king's farm'); hence also a meal, a feast, and, generally, entertainment (of a guest or, as a tenant's duty, of his lord), harboring (of a fugitive); also, rarely, use, advantage (*> feorman, go-feorman*, supply with food, sustain, entertain, receive (a guest), harbor (a fugitive), etc., *> feormere*, a purveyor (of a guild), *feormung*, and *fyrdth*, a harboring (of fugitives), etc.); orig. perhaps 'a living, means of subsistence,' connected with *feorh*, life, = *OHG. ferah, ferh* = *OHG. ferah, ferh*, MHG. *ferch* = *Teut. for*, life, = *Goth. farhvaus*, the world. But as *AS. feorm* is always rendered in ML. by *firma* or *ferma*, which is formally identical with the fem. of *firma*, ML. often spelled *fermus* (*> OF. ferme*, *ME. ferme*, *> mod. E.*, with restored *i* vowel, *firm*), most writers have assumed the actual identity of the two words (*L. firma*, fem. adj., and *ML. firma* or *ferma*, *n.*), 'either because the farms were at first inclosed or fortified with walls, or because the leases were confirmed or made more certain by signature': see *firm*, *a., firm*, *v., firm*, *n.* But the *AS. form* appears to be the original. The *ML. firma, firma* has the *AS.* senses, and, later, the senses of rent, revenue, particularly as collected by a farmer or factor, also in general a tax, tribute, impost. Hence *OF. ferme*, *F. ferme* = *Pr. ferme*, in same senses, the *OF.* being partly the source of the *ME.* form. The mixture of forms and senses has confused the history of the word. The purely agricultural sense is comparatively modern. 1. In old English use, the revenue or rent from lands under lease; revenue, rent, or income in general, but originally chiefly in the form of natural products.

We go to gain a little patch of ground
That hath in it no profit but the name.

Shak., Hamlet, iv. 1.

Specifically—2. To lease or let (taxes, imposts, or other duties) for a term at a stated rental; generally with *out*. It was formerly customary in some European countries, and is still in some eastern ones, for the ruler or government to farm the revenues (taxes or rents, imposts, and excise) to individuals for a certain percentage on the amount collected, or for the payment of fixed sums, the farmers of the revenue retaining the surplus of their collections.

faro (fä'rō), *n.* [Also written *pharao*, *pharaon*, after F. *pharaon*; said to be named from a figure formerly on one of the cards, representing Pharaoh, King of Egypt.] A game played by betting on the order in which certain playing-cards (with reference simply to face-value) will appear when taken singly from the top of the pack. The players sit at one side of a table, and the dealer at the other. The dealer always represents the bank, having in charge the paying and claiming of bets. In the United States the table has on its center the "lay-out," or representation of thirteen cards, from the ace up to the king, in regular order. After bets have been placed on single cards or combinations, the dealer removes the top card from a complete pack placed face up in a box, which card does not count, he then withdraws the next one, leaving the third exposed, and claims all bets made on the card equal in value to the one withdrawn and pays those made on the other; the appearance together of two cards of the same value is called a "split," and the better loses half of his stake. Any bet may be "copped" by placing a button on top of the money or checks, and this changes the bet to one that the card will show for the dealer. The showing of two cards constitutes a "turn," and after each turn in which bets are made for another, down to the last three cards of the pack; the only betting allowed after this is on "calling the turn," or guessing which will show first. The European game is essentially the same, except that the layout is arranged in a small book.

3. A time of fasting; the prescribed period or duration of abstinence. The only fast ordained by the Mosaic law was that of the day of atonement, but other fasts were subsequently instituted on account of great national calamities, and special fasts also were appointed on account of special impending peril. In the Roman Catholic Church all baptized persons over twenty-one years of age are required to observe appointed days of fasting, on which, subject to certain exceptions and exemptions, as the requirements of health, they are required not to eat more than one full meal. These days include the forty days of *Lent*, the ember days, the Fridays of the four weeks of Advent, and the vigil of Pentecost or Whit Sunday, of the feasts of St. Peter and St. Paul, of the Assumption of the Virgin Mary, of All Saints and of Christ mas day. All Fridays not fast days are days of abstinence (see *fast-day*, I.). In the Greek Church, in addition to the forty days of *Lent*, there are three principal fasts, each lasting a week: (1) that of the Holy Spirit, immediately after Pentecost; (2) that of the Virgin, in August; and (3) that of the Nativity. In the Episcopal Church, Ash Wednesday and Good Friday are fasts, *Lent*, the ember days, the three rogation days, and all Fridays are only days of abstinence.

A day on which fasting is observed; specifically, a day appointed for fasting as a religious observance by some recognized authority, ecclesiastical or civil; in the most restricted ecclesiastical sense, a day on which, or on part of which, total abstinence from food is proscribed, in contradistinction to a day on which a limitation is imposed on the kind or quantity of food to be taken, called a *day of abstinence*. See *fast³*, n. In some of the United States, especially in New England, special days of fasting and prayer are appointed by the governor of the State, a custom derived from the original Puritan settlers.

The Pilgrims found it written, "They that sow in tears shall reap in joy. He that goeth forth and weepeth, bearing precious seed, shall doubtless come again with rejoicing, bringing his sheaves with him." This beautiful poetry was translated into the policy of the Pilgrims by establishing a *Fast day* in March or April, and a Day of Thanks giving in November. Thus the whole people were to pass through the two gates of the year, Tears and Smiles, and observe them as Holy Days, all other profane and mis leading festivities, Christmas, New Year's, and Saint's days without number, being laid aside.

H. W. Beecher, Serwood, xlix.

2. In Scotland, a day set apart for humiliation and prayer; specifically, a day thus observed during the week immediately preceding certain celebrations of the Lord's supper. *Business* is generally suspended during these *fast-days*. II. *n.* [= D. *vet*, G. *fett*, Sw. *fett* = Dan. *fedt*, *fat*, *n.*; from the adj.] 1. A white or yellowish oily solid substance forming the chief part of the adipose tissue of animals, and also found in plants. In chemistry the fats are odorless, tasteless, colorless or white bodies which may be either solid or liquid. They are insoluble in water and cold alcohol, but dissolve freely in ether, chloroform, and benzine. The solid neutral fats, like spermaceti, suet, and lard, and the liquid non-volatile oils, like sperm and olive oil, are classed together as *fats*. They are compound ethers formed by the union of fatty acids with the triatomic alcohol glycerin. They are composed of carbon, hydrogen, and oxygen, but contain no nitrogen. The most common and abundant are stearin, palmitin, and olein. Of these stearin and palmitin are solids at ordinary temperatures, and olein is a liquid. Most animal and vegetable fats are mixtures of two or more of the simple fats, and their hardness depends largely on the relative quantity of olein or other liquid fat in them. When a fat is treated with an alkali, the fatty acid unites with the alkaline base, making a soap, and glycerin is set free. When a soap is treated with an acid, the base is taken from the fatty acid which is thus set free.

fatalism (*fä'tal-izm*), *n.* [= D. G. *fatalismus* = Dan. *fatalisme* = Sw. *fatalism*, *<* F. *fatalisme* = Sp. Pg. It. *fatalismo*; as *fatal* + *-ism*.] 1. The doctrine that all things are subject to fate, or come or go by inevitable predetermination.

Fatalism is a doctrine which does not recognize the determination of all events by causes, in the ordinary sense; holding, on the contrary, that a certain foreordained result will come about, no matter what may be done to prevent it. *Fatalism* is thus directly opposed to *necessitarianism*, according to which every event is determined by the events which immediately precede it, in a mechanical way. *Necessitarianism* seems hardly to leave room for final causes, while *fatalism* is the doctrine that certain results are sure to come in spite of all that efficient causes may do to prevent them. See *necessity*.

To confute these three *fatalisms*, or false hypotheses of the system of the universe, Cudworth designed to dedicate three great works: one against atheism, another against immoral theism, and the third against the theism whose doctrine was the inevitable "necessity" which determined all actions and events, and deprived man of his free agency.
I. D'Israeli, *Amen. of Lit.*, II. 308.

Necessity simply says that whatever is, and will vary with varying conditions. *Fatalism* says that something must be; and this something cannot be modified by any modification of the conditions.

A festival in commemoration of some event, or in honor of some distinguished person; a set time of festivity and rejoicing; opposed to *fast*. In this sense the word is almost entirely confined to ecclesiastical feasts. In the Jewish church the most important feasts, apart from the sabbath, were those of the Atonement, the Passover, Tabernacles, and Pentecost. To these were subsequently added the feasts of Purim and the Dedication. In the Christian church Christmas and Easter are feasts of almost universal recognition and observance. To these many others have been added, celebrating events in the life of Christ or in the lives of the apostles, saints, and martyrs. Feasts are divided into *movable* and *immovable*, according as they occur on a specific day of the week succeeding a certain day of the month or phase of the moon, or at a fixed date. Easter is a movable feast, upon which all other movable feasts depend; Christmas is an immovable feast. In the Roman Catholic Church feasts are further divided into *obligatory* and *non-obligatory*, and again into *double*, *semi-double*, *simplex*, etc., according to the religious offices required to be recited in the church service.

Double feast, an ecclesiastical festival on which the antiphon is doubled. See *semi-double* and *simplex*. — **Feast of asses.** See *feast of fools*. — **Feast of Dolours.** See *dolor*. — **Feast of Eggs.** See *Egg Saturday*, under *egg*.

Feast of fools and feast of asses, festivals, simulating the Saturnalia, and perhaps a survival of them, celebrated in many countries of Europe, especially in France, during the middle ages, from Christmas to Epiphany, but chiefly on the 1st of January in each year. In the *feast of fools* a bishop, archbishop, or pope of fools was chosen and placed on a throne in the principal church, and a burlesque high mass was said by his orders. The *feast of asses*, following the former or celebrated on a later day, was a pageant that owed its name to the important part which the ass played in it. In some places the allusion was to the ass of Balaam, in others to the ass which is said to have stood beside the manger in which the infant Saviour was laid, or to the ass on which Mary and the child fled into Egypt, or in others still, to the ass on which Jesus made his triumphal entry into Jerusalem. Some of the features of these festivals still survive in the carnival.

— **Feast of lanterns**, a Chinese festival held annually at the first full moon of the year (the 15th day of the first month), when colored lanterns are hung at every door, and the graves are illuminated. — **Feast of Maccabees**, in the ancient Christian church, a festival celebrated annually in honor of the seven Maccabees, who died in defense of Jewish law. It is uncertain on what day the festival was held, but the Roman Catholic martyrology places it on the 1st of August. — **Feast of Orthodoxy**, of the Dedication, of the Sacred Heart, of the Presentation, etc. See *orthodoxy*, *dedication*, *heart*, etc. — **To make feasts**,

A federal government is properly one in which the federal authority is independent of any of its component parts within the sphere of the federal action distinguished from a confederate government, in which the states are sovereign, and which possess no inherent power.

The wants of the union are to be supplied in one way or another, if by the authority of the federal government, then it will not be meant to be done by that of the state government. *Hamilton, Federalist*, No. XXXVI.

It controlled the general government till 1801, then declined, and about 1824 became extinct. Its chief aims were the creation and maintenance of a strong central government, the strengthening of the spirit of nationalism, the control of politics by the more intelligent and substantial classes, the fostering of commercial interests, and the preservation of friendly relations with Great Britain.

federalism (*fed'ér-ál-izm*), *n.* [= *F. fédéralisme* = *Sp. Pg. It. federalismo*; as *federal* + *-izm*.] The doctrine or system of federation or federal union in government; the principle of assigning to the care of a central government such matters of common concernment as may be agreed upon, and all others to that of the governments of the federated states, provinces, or tribes; more specifically, the aggregate principles or doctrines of a federal party, as the Federalists of the United States. Federalism has been practised by many uncivilized races, as the ancient German tribes and some of the American Indians, chiefly for warlike purposes. It existed for certain civil purposes also among the Greeks and other ancient and medieval peoples, as in the English heptarchy, was more largely developed in the old German empire, and has since been adopted in many countries, especially republics (See *federal*, *a.*, 2.). Its introduction into France was advocated by the Girondists after the fall of the monarchy.

We see every man that the Jacobins chose to apprehend taken up, . . . whether he be suspected of royalism or federalism, moderation, democracy royal or any other of the names of the faction which they start by the hour. *Burke, Policy of the Alliance*.

Intense Federalist as he was, his *Federalism* agreed with a stout anti-aristocratic spirit.

H. E. Scudder, Noah Webster, p. 46. Stated broadly, so as to acquire some what the force of a universal proposition, the principle of *federalism* is just this: — that the people of a state shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distant governing body could possibly exercise; but that as regards matters of common concern between a group of states, a decision shall in every case be reached, not by brutal warfare or by wily diplomacy, but by the systematic legislation of a central government which represents both states and people, and whose decisions can always be enforced, if necessary, by the combined physical power of all the states. *J. Fiske, Amer. Pol. Ideas*, p. 133.

The method by which *federalism* attempts to reconcile the apparently inconsistent claims of national sovereignty and of state sovereignty consists of the formation of a central institution under which the ordinary powers of sovereignty are elaborately divided between the common or national government and the separate States.

A. F. Bacon, Law of Const., p. 131.

It. federalista*; as *federal* + *-ist*.] **1.** In *politics*, an advocate or a supporter of federalism; specifically, an advocate of a close union of states under a common government, or a supporter of such a union as against those who would weaken or destroy it; in U. S. hist., [*cap.*] a member of the Federal party. See *federal*, *a.*

And according to the degree of pleasure and pride we feel in being republicans ought to be our zeal in cherishing the spirit and supporting the authority of *Federalists*. *Madison, Federalist*, No. 10.

The *Federalists* were the only proper Tories; no politician have ever produced, whose conservatism truly presented an idea, and not a mere selfish interest, men who honestly trusted democracy, and stood up for experience, or the tradition which they believed for such, against capitalism. *Lowell, Study Windows*, p. 105.

The party name of *Federalist* has since become historical, and yet, to speak logically, it was the Anti Federal party that sustained a federal plan, while the *Federalist* concluded for one more nearly national.

Schiller, Hist. U. S., I. 34.

Fiezel, *foazel*, also written *jaeze*, *jeize*, *phoeze*

feld², feldet, v. Obsolete forms of *feld¹*.

Feldsher (feld'sh'er), *n.* [*Russ. feld'sher* = *Litt. Russ. fel'sher*, < *G. feldscher, feldscheuer* (cf. *D. feldschorder*, *Dan. feldsger*, *Sw. fält-scher*), an army surgeon, < *feld*, field, = *E. field*, + *scherer, scheerer*, barber, = *E. shearer*.] In Russia, a surgeon's assistant; a hospital orderly.

"What is this *Feldsher*?"
"He's an old soldier who dresses wounds and gives physic."
D. M. Wallace, Russia, p. 60.

Feldspar (feld'spär), *n.* [A var. of *feldspath*, accom. to *E. spar*.] In mineral, one of a very common group of closely related minerals, all silicates of aluminum, together with either calcium, sodium, potassium, or in one case barium. They crystallize in the monoclinic or triclinic system with closely similar angles. The prismatic angle is not far from 120°, and they have two easy cleavages which make an angle of 60° or nearly 90°, with each other. Their specific gravity lies between 2.6 and 2.8, and their hardness between 6 and 7. In color they vary from clear and glassy to white, grayish, and light shades of yellow, red, or green, rarely darker green to black. They occur in distinct crystals, also in massive forms varying in structure from coarsely cleavable to granular-crystalline, compact, and hornstone-like. They form an essential constituent of many of the common crystalline rocks, as granite, gneiss, syenite, diorite, most kinds of basalt, andesite, trachyte, etc. The monoclinic feldspars are orthoclase and hyalophane. The former is a potash feldspar (see *orthoclase*), and is the commonest of the group; the latter is a barium feldspar, and is a rare species. Closely related to orthoclase is the triclinic microcline (which see), having the same composition, but varying slightly in form. Besides these there are the triclinic (lime-soda) feldspars, called in general *plagioclase*, because of the oblique angle between their two cleavages, and forming a series varying progressively in composition, form, optical characters, and specific gravity from the lime feldspar anorthite to the sodium feldspar albite; the intermediate species are considered as isomorphous compounds of these two extremes in varying proportions. Those ordinarily recognized are named in order, labradorite, andesine, and oligoclase, the last approaching most closely to albite. The increase in soda in the members of the series is accompanied by an increase of silica, the species being increasingly acidic in the order named: thus, andesine contains 43 per cent. of silica, and albite 60 per cent. The specific gravity diminishes in the series from anorthite (2.76) to albite (2.61). Certain triclinic feldspars containing considerable potash and with an angle of cleavage varying but little from 60° are sometimes grouped under the name *orthoclase*. Common feldspar, or orthoclase (and microcline), is much used in the manufacture of porcelain; some kinds are employed for ornaments, as aventurin feldspar or sunstone, also moonstone (an opalescent variety of orthoclase), albite or oligoclase, and most of all, the species labradorite, beautiful for its play of colors. Also *felspar*. **Blue feldspar**. Same as *labradorite*. **Glassy feldspar**. See *orthoclase*. **Labrador feldspar**. Same as *labradorite*. **Resplendent feldspar**. Same as *labradorite* or *moonstone*.

An unwoven fabric of short hair or wool, or of wool and fur, agglutinated or matted together, with the aid usually of moisture and heat, by rolling, beating, and pressure. The property of felting results chiefly from the serrated or jagged structure of wool and most hairs, as well as from the crimped or wavy form natural to some animal fibers. The making of felt is thought to have originated at a very early date in the western part of Asia, and the best and most durable felt is still made in Persia and the neighboring countries. Felt floor mats an inch or more thick and of admirable texture and printed in rich designs in color are used upon marble and tiled floors in Persia. (See *mosaic*.) In Europe throughout the middle ages and later, felt was a usual material for hats, and was also used for stuffing or bombasting garments for both defense and fashion. Felt is now in general use not only for hats, but for clothing and upholstery, carpets, table-covers, and mats, jackets for steam-boilers, etc., and lining for roofs and walls. Broad cloth and other felled wool on fabrics are partially felted by the process of fulling; and the familiar shrinkage of wooden garments in washing results from an unthought felting, which draws the fibers of the fabric closer together.

(2) A fabric made of hair, or asbestos and hair, sometimes saturated with a lime cement, used on steam pipes and boilers as a non-conducting covering. (3) A compound of liquid cement and animal or vegetable fiber, applied with a brush for the same purpose. **Paper-makers' felt,** a coarse, twilled, loosely woven material, neither tanned nor shorn, used in paper-manufacture to place between wet sheets. **Roofing-felt,** a material similar to lining felt, used as a covering for roofs. This material is usually not a true felt, but an agglutination of hair or other animal fibers, compounded with a preparation of tar, and rolled into sheets. It is nailed down upon the roof in overlapping strips, and is usually coated subsequently with tar, or some special heavy pigment having tar or asphalt as a basis and commonly called *emement*.

apex, along its posterior surface, bearing upon its upper extremity, by an oblique neck, a hemispherical head, and two trochanters, the greater and the lesser, and expanding below into two large condyles, the inner and the outer, both of which articulate with the tibia, but neither with the fibula. The slenderness of the bone is beyond an average for mammals, though in some it is still slenderer. Many femora, as of the horse, develop a third trochanter, and also may articulate with both bones of the leg. The reception of the head of the femur in the acetabulum is such that it articulates above with all three of the pelvic bones, the ilium, the ischium, and the pubis. Fermatian (fêr-mâ'shi-ân), a. Pertaining to the French mathematician Pierre de Fermat (1601-65). **Fermatian reasoning**, reasoning in the following form: "A certain character, *P*, if possessed by any one of a linear series of subjects, is necessarily possessed by the next following subject; now, the character *P* is possessed by the first subject of the series; ergo, it is possessed by all the subjects." The discovery of this form of reasoning by Fermat opened the theory of numbers to the researches of mathematicians. It holds good even if the series is infinite, so long as it contains no member which cannot be reached by proceeding by successive steps from the first member, as is the case, for example, with the entire class of finite positive integer numbers. In this particular Fermatian reasoning is contrasted, for example, with the syllogism of transposed quantity, which holds only for finite classes. On the other hand, the Fermatian inference fails in such a case as the following: If Achilles, pursuing a tortoise, is behind it at any instant, then he will still be behind it when he reaches the point where the tortoise now is, but he is behind it at that instant; therefore, he will always be behind it. The following is equally absurd: If any whole number is finite, the next greater whole number is finite, and so is finite; hence, all whole numbers are finite.

fermet, n. An obsolete variant of *farm*.

ferment (fêr'ment), n. [= *F. ferment* = *Sp. Pg. fermentation (fer-men-tä'shon), *n.* [= *F. fermentatio* = *Sp.* *fermentacion* = *Pg.* *fermentação* = *It.* *fermentazione*, < *L.* as if **fermentatio* (*n.*), < *fermentare*, ferment; see *ferment*, *v.*] 1. A gentle boiling or ebullition.—2. A decomposition produced in an organic substance by the physiological action of a living organism or by certain unorganized agents. See *ferment*. Fungi (and especially species of *Saccharomyces*) and bacteria are the agents of fermentative processes or changes. Fermentation naturally ceases when the nutritive elements of the fermented substance are exhausted, or a sufficient proportion of a substance (as alcohol) deleterious to the ferment-organism is produced. It may be checked or altogether prevented by anything which prevents the growth of the organism, as by a reduction of the temperature, or by subjecting to a temperature too high or too low, by the presence of too large a proportion of sugar or of a substance (called an antiseptic) which acts as a poison to the organism. There are various kinds of fermentation, each of which is caused by special organisms. Alcoholic fermentation in saccharine solutions, or fermentation in its most restricted sense, may be produced

by any of several organisms, including several species of *Saccharomyces*, *Mucor*, *Penicillium*, and *Aspergillus*, and to a slight extent by certain other fungi; but the most important agent is *Saccharomyces cerevisiae*, which produces the fermentation of beer. In fermenting wine, several species of *Saccharomyces* are found. *S. Mycoderma* forms a mold like growth on the surface, the so-called *flavour of wine*. *Acetous fermentation* takes place in liquids which have undergone alcoholic fermentation, and is caused by *Micrococcus (Mycoderma) aceti*, the vinegar plant. The alcohol is oxidized, and acetic acid or vinegar is the result. This micrococcus takes two forms: the immersed or anaerobic form exists as a nameless mass called the *mother of vinegar*; the other is the surface or aerobic form, the *flowers of vinegar*. According to Pasteur, the latter only is active in producing fermentation. *Lactic fermentation*, or souring of milk, is induced by certain bacteria which decompose the sugar of milk and produce lactic acid. *Vacuous fermentation* is of two kinds: the one is caused by certain bacteria which convert the fermenting substance into a slimy mass and produce manure; the other is caused by *Lactobacillus casei*, which brings about the slimy condition, but does not produce manure. The latter occurs in saccharine solutions, and is a source of serious loss to sugar manufacturers on the European continent. The agent in *butyric fermentation* is *Bacillus ambibacter*, and butyric acid is the result. Certain fermentative changes are produced in wood by various fungi. *Putrefactive fermentation*, or putrefaction, occurs in animal substances and plant products containing a large proportion of nitrogenous matter. The organism which is active in the putrefaction of beef is *Bacterium termo*. The anaerobic fermentation of urine is caused by *Micrococcus uree*. See *putrefaction*, *bacterium*, and *germ theory*, under *germ*.

Fermentation is a very general phenomenon. It is life without air, or life without free oxygen, or, more generally still, it is the result of a chemical process accomplished on a fermentable substance.

a mortise in the steel breech piece, and in the large callers it is moved in and out by a translating screw on one side. The block is locked in position by a second screw having a part of its thread cut away so that a partial turn causes it to engage or disengage in the breech of the gun. The French or interrupted-screw fermeture is a steel screw with its exterior divided into sextants or arcs of 60° each. The screw-threads are removed from the alternate arcs, which thus present a plain cylindrical surface. The interior surface of the breech of the gun is similarly formed with alternate blank and threaded sectors. In closing, the threaded sectors on the block are brought opposite the blanks in the breech, and the block is inserted by turning a translating screw; then one sixth of a turn of the block to the right engages the threads on the block with those in the breech and closes the chamber. Range or Preire gas check is generally used with this system of fermeture. The fermeture of the Hotchkiss mountain-gun consists of a simple prismatic wedge, with a locking screw engaging in a recess in the breech. A handle on one side serves to close and draw out the block, and to lock it. This form of block has merely to support the head of the cartridge case, which acts as its own gas-check. The fermetures for small-arms present a great variety of combinations and movements. The most important are the rotating breech-block, as in the United States Springfield and Martini-Henry rifles; the sliding breech-block, as in the Sharps and Winchester rifles; and the sliding bolt, as in the Hotchkiss and Chaffee-Reeco rifles. In all modern small-arms the metallic cartridge-case serves as a gas-check or obturator. See *gas-check*, *interrupted screw* (under *screw*), *obturator*, and *cut under cannon*.

Bohem. paprat = Pol. paproc = Russ. paporot = Lith. papartis, fern.* Some compare *Skt. parva*, wing, feather, leaf, tree (applied to various plants); the same connection of thought appearing in the Gr. *ptēpē*, a fern, *ptēpōs*, a wing, feather, = *E. feather*.] One of a large group of vascular cryptogamous plants, constituting the natural order *Filices*. They are herbaceous, rarely shrubby or arborescent plants sometimes with long creeping rhizomes. But in many cases the rootstock or caudex is erect, when the species is called a *tree-fern*. The fructification, which is asexual, consists of spores produced in sporangia upon the backs or margins of the fronds. The sporangia in most genera are collected in definite clusters (*sori*), and these are usually covered by a special covering membrane, or one formed from the margin of the frond, called an *indusium*. Each sporangium is formed from a single epidermal cell. In the largest suborder, the *Polypodiaceae*, the sporangia are stalked and provided with a vertical, many-jointed ring, which ruptures at maturity, allowing the escape of the spores. In the other suborders the ring is less perfectly developed, or wanting. The spores in germination produce a green prothallium upon the surface of the soil, and upon the under surface of the prothallium antheridia and archegonia are monicously produced. After fertilization the germ-cell of the archegonium develops into a frond bearing plant. About 2,000 species of ferns are known. They are found all over the world, but abound in humid temperate and tropical regions. Great Britain has about 60, temperate North America about 100, India about 600. Ferns are very abundant as fossil plants. The earliest known forms occur in Devonian rocks, and their remains are very common in connection with coal of the Carboniferous period. Plants of the related group *Ophioglossaceae* also are called ferns.

Capillus Veneris*. **Royal fern**, *Osmunda regalis*. **Scented fern**, *Nephrodium drooping*, from the citron odor of its fronds when gently rubbed. **Sensitive fern**, *Onclea sensibilis*. **Sweet- or meadow-fern**, the *Myrica Comptonia* or *Comptonia asplenifolia*, a myricaceous shrub of North America, with fragrant fern-like foliage. Any material object regarded with awe, as having mysterious powers residing in it or as

being the representative or habitation of a deity to which worship may be paid, and from which supernatural aid is to be expected. A *fetish* may be an animal, as a cock, a serpent, a bear, etc., or an inanimate object, as a tree, a river, a stone, a tooth, a shell, a shaving, etc. The worship of *fetishes* belongs to a low and brutish stage or form of religion.

Fetishes of Dahomey, Africa.

When the king [in Guinea] will sacrifice to *Fetisso*, hee commands the *Fetissoero* [Pg. *feticeiro*, sorcerer] to enquire of a Tree, whereto he sacrificeth. Duhulie, what hee will demand.
Purchas, *Pilgrimage*, p. 631.

To class an object as a *fetish* demands explicit statement that a spirit is considered as embodied in it or acting through it or communicating by it, or at least that the people it belongs to do habitually think this of such objects; or it must be shown that the object is treated as having personal consciousness and power, is talked with, worshipped, prayed to, sacrificed to, petted or ill-treated with reference to its past or future behaviour to its votaries.
E. B. Tylor, *Prim. Culture*, II, 184.

Before experience had yet taught men to distinguish between the possible and the impossible, and while they were ready on the slightest suggestion to ascribe unknown powers to any object and make a *fetish* of it, their conceptions of humanity and its capacities were necessarily vague and without specific limits.
H. Spencer, *Universal Progress*, p. 60.

Hence—2. An object of blind devotion; an idol: as, gold has become his *fetish*.

No faith in the cross that makes a *fetish* of the cross is going to stand proof.
Rushnell, *Forgiveness and Law*, p. 92.

His return at any hour or any moment was the *fetish* that she let no misgiving blaspheme.
Hawells, *Modern Instance*, xxv.

You are always against superstitions, and yet you make work a *fetish*.
W. Black, *Princess of Thule*, x.

N. A. Rev., CXLII, 454.

3. Same as *fetish-man*.

Anything which happens, even in the most ordinary course of nature, he may pronounce to be the work of a *fetish* or a wizard, and to need his assistance to ferret it out.
Nineteenth Century, XXII, 301.

fetichism (fê'tish-izm), *n.* [Also, after the French, *fetichism*, and sometimes *fetichism*; = F. *fétichisme*; as *fetish* + *-ism*.] 1. The practice of worshipping a *fetish*; that form of religious belief and practice in which *fetishes* are the objects of worship. See the extracts.

The President de Brosses, a most original thinker of the last century, struck by the descriptions of the African worship of material and terrestrial objects, introduced the word *Fetichisme* as a general descriptive term, and since then it has obtained great currency by Comte's use of it to denote a general theory of primitive religion. In which external objects are regarded as animated by a life analogous to man's. . . . It seems to me . . . more convenient to use the word Animism for the doctrine of spirits in general, and to confine the word *Fetichisme* to that subordinate department which it properly belongs to; namely, the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects. *Fetichisme* will be taken as including the worship of "stocks and stones," and thence it passes by an imperceptible gradation into idolatry. *E. B. Tylor*, *Prim. Culture*, II, 182.

Fetichisme is almost the opposite of Religion. It stands towards it in the same relation as Alchemy to Chemistry, or Astrology to Astronomy, and shows how fundamental is our idea of a deity differs from that which presents itself to the savage. The Negro does not hesitate to punish a refractory *Fetish*, and hides it in his waste-loft if he does not wish it to know what is going on. Aladdin's lamp is, in fact, a well known illustration of a *Fetish*.
Sir J. Lubbock, *Orig. of Civilization*, p. 349.

A latent *fetichism*, which is betrayed in that love of personification, or of applying epithets derived from sentient beings to inanimate nature, . . . is the root of a great part of our opinions.
Locky, *Europ. Morals*, I, 372.

ML. reflex of the OHG., etc., would be *feum*, which actually occurs in the *Doomsday Book*. *Feud*² and its derivatives are less prop. spelled *feh*, etc.] 1. In *feudal law*, an estate in land granted on condition of services to be rendered to the grantor, in default of which the land was to revert to the grantor; a fief; a tenure of land under and by dependence on a superior. The grantor or lord was entitled to the homage or fealty of the grantee or vassal. The estate was so called in contradistinction to *allodium*, which is an estate subject to no superior but the general law of the land.

Palgrave considers that the origin of feudal tenure may be traced to the grants made by the Romans to the barbarian Laeti occupying the Limitanean or Riparian territories, upon the condition of performing military service. These donations or *feuds* descended only to the male heir of the donee, and could not be alienated to a non-military tenant. *F. Madden, Intro. to O'Curry's Anc. Irish*, p. cxxviii.

2. Land held in feudal tenure by a vassal.

The essential and fundamental principle of a territorial *feh* was, that it was land held by a limited or conditional estate—the property being in the lord, the usufruct in the tenant. *W. A. Sullivan, Intro. to O'Curry's Anc. Irish*, p. cxxviii.

Pertaining to feuds, fiefs, or fees; relating to or dependent upon the method of landholding called feud, fief, or fee; as, *feudal tenure*; *feudal rights* or services; a *feudal lord* or vassal.

The feudal tenure, which was certainly at first the tenure of servants who, but for the dignity of their master, might have been called slaves, became in the Middle Ages the tenure of noblemen. *Maitre, Early Law and Custom*, p. 341.

The old feudal spirit which prompted a man to treat his tenants and vassals as part of his stock . . . had been crushed before the reign of Edward III. *Stubbs, Const. Hist.*, § 469.

2. Pertaining to the state of society under this system of tenure; characteristic of the relations of lord and vassal.

It is time . . . that we had a feudal map of England before the manorial boundaries were wiped away. *Stubbs, Medieval and Modern Hist.*, p. 61.

Feudal system, a system of political organization with reference to the tenure of land and to military service and allegiance prevalent in Europe in the middle ages. Its main peculiarity was that the bulk of the land was divided into fiefs or fiefs, held by their owners on condition of the performance of certain duties, especially military services, to a superior lord, who, on default of such performance, could reclaim the land. This superior might be either the sovereign, or some subject who thus held of the sovereign, and in turn had created the fief by subinfeudation. According to the pure feudal system, the lord was entitled to the fealty of his tenants, but not to that of their subtenants, every man looking only to his immediate lord. On the continent of Europe, while the system was in full operation, this principle made the great lords practically independent of their nominal sovereigns, who could command their allegiance only through their self-interest or by superior force, and therefore kings were often powerless against their vassals. In England, however, the sovereign was always entitled to the fealty of all his subjects. Feudal tenures were abolished in England by act of Parliament in 1660, in Scotland in 1747, and in France at the revolution of 1789. In Germany, Austria, etc., they continued till after the revolutionary movements of 1848-50. In each case, however, they had long previously been much mitigated in their social and political effects. A feudal system prevailed in China from a very early period, but was brought to an end in 1911, on the conquest of the whole country by Sen. Wang of Tsin, known as Tsin-shi Huang Ti. The feudal system of Japan was abolished in 1868, when the daimios or lords surrendered their lands to the mikado. See *durum*.

'a trembling,' akin to Gr. *o. iedak*, flee affrighted, quakes, flight, panic fear, fear, terror.] 1. In *pathol.*: (a) A temperature of the body higher than the normal temperature, appearing as a symptom of disease; pyrexia. The temperature of the body in health is 37° centigrade, or 98.6° F., and is maintained at this point by the adjustment of the production of body heat to its dissipation, both of these processes being largely under nervous control. During the period of invasion of a fever, or at any time when the temperature is rising, the heat produced exceeds the heat lost. If the rise is very rapid, the withdrawal of the blood from the skin, which diminishes the loss of heat, may give rise to a cold sensation or chill, which may be combined with an attack of shivering. By the latter the production of heat is increased. During fever the production of heat, while it may be greater than in a healthy body at rest, does not exceed what a healthy body can dispose of without experiencing increase of temperature. The consumption of the tissues of the body in fever exceeds ordinarily the repair, and there is more or less emaciation. The excretion of urea is increased; the pulse is usually quickened as well as the respiration; the bowels are apt to be constipated; and the loss of appetite, head ache, and vague pains are commonly complained of. Fever is caused by zymotic poisons, by local inflammation, or by over-heating as in sunstroke, and is sometimes of exclusively nervous origin. It is unquestionably injurious to the patient when it is excessive or too long continued; it is some cases where it does not exceed certain limits, it is very probably innocuous, or may even be advantageous. Fever would ordinarily be called slight up to 101° or 102° F., moderate up to 103° or 104° F., and high above this. Temperatures above 104° F. would be called excessively high, and to such the name of *hyperpyrexia* is applied.

The limits of the significations of these terms are not precisely marked; they vary somewhat in the usage of different individuals. The prognostic significance of pyrexia depends on the accompanying conditions. (b) The group of symptoms consisting of pyrexia and the symptoms usually associated with it. (c) A disease in which pyrexia is a prominent symptom: as, typhoid fever, scarlet fever, etc.

The attack may recur after a week, and several such recurrences may take place. The mortality is from 2 to 4 per cent. For synonyms, see phrases above and below.—*Remittent bilious fever*. (a) Remittent fever. (b) Relapsing fever. (c) Ardent continued fever.—*Remittent fever*, a malarial fever in which periods of high temperature alternate with periods in which the temperature is less, but not as low as normal. It is produced by the same agent as intermittent fever.—*Remittent bilious fever*. (a) Dengue. (b) Remittent fever.—*Remittent icteric fever*, relapsing fever.—*Rheumatic fever*, acute rheumatism.—*Roman fever*, malarial fever contracted in Rome; but the word is loosely used by travelers to designate typhoid and other often insignificant affections.—*Scarlet fever*, a contagious fever in which typical cases exhibit the following features: After a period of incubation of from three to seven days there is a sudden rise of temperature, accompanied with sore throat, vomiting, very frequent pulse, headache, and often, in small children, convulsions. After about one day the scarlet eruption appears, which lasts for three or four days in its original intensity, and then begins to fade out, when desquamations sets in. Among complications and consequences may be mentioned the formation of diphtheroid membranes in the throat, abscesses of cervical lymphatic glands, inflammation of the ear, and acute inflammation of the kidneys. The contagion may preserve its vitality for months in clothes, bedding, carpets, etc. One attack usually protects against subsequent infection.—*Seasoning fever*, a mild form of (a) remittent fever; (b) yellow fever in new-comers.—*Septan fever*, intermittent fever in which the paroxysm recurs on the seventh day (both paroxysmal days being counted).—*Septic fever*, the fever arising from ill-treated wounds, from the infection of the system with their morbid products or the bacterial germs flourishing in them.—*Seven-day fever*. (a) Same as *septan fever*. (b) Relapsing fever.—*Seventeen-day fever*, remittent fever with relapse on the seventeenth day.—*Sextan fever*, intermittent fever in which the paroxysm recurs on the sixth day (both paroxysmal days being counted).—*Short fever*, relapsing fever.—*Sierra Leone fever*, a form of remittent fever.—*Simple anthenic fever*, simple continued fever with debility.—*Simple continued fever*, a fever, usually mild, lasting from a few hours to a few days, independent of local inflammation, and neither

in its features nor in the circumstances under which it arises disclosing its identity with other better-marked forms. Under the name are doubtless included in actual practice many mild and abortive cases of typhoid, malarial, and other fevers, some cases of purely neurotic origin, and possibly some dependent on a distinct unknown zymotic cause. Also called *synocha*, *synochus*, *synopsis*, *febrilis*, *epidemicus*, *epidemic fever*, *sun fever*.—*Slow nervous fever*, typhoid fever.—*Solar fever*, dengue.—*Spirillum fever*, relapsing fever.—*Splenic fever*. Same as *malignant anthrax* (which see under *anthrax*).—*Spotted fever*. (a) Typhus fever. (b) Cerebrospinal meningitis.—*Spring fever*, a feeling of lassitude occurring in spring, supposed to be due to the change of season; also, humorally, mere laziness. (Colloq., U. S.)—*Strangers' fever*. Name as *yellow fever*.—*Sudatory fever*, sweating-sickness.—*Summer fever*, hay fever.—*Surgical typhus fever*, pyrexia.—*Synochal fever*, synocha.—*Synochoid fever*, simple continued fever.—*Tertian fever*, intermittent fever in which the paroxysm recurs every third day (both paroxysmal days being counted).—*Thermic fever*, pyrexia from overheating.—*Three-day fever*, dengue.—*Typhoid fever*, a fever the more typical cases of which, resulting in recovery, present the following features: (1) A period of incubation of two weeks, more or less, terminating in prodromata lasting for a few days, and consisting in a general tired feeling and indisposition to exertion of any kind, loss of appetite, usually some constipation, slight headache, and pains in the limbs. (2) A period of invasion of a week or less, characterized by a gradually increasing temperature, with morning remissions and evening exacerbations, want of appetite, thirst, dry and coated tongue, frequent pulse, headache, often nose-bleed, usually constipation, often slight diarrhea, slightly tympanitic abdomen, with perhaps some tenderness and gurgling in the right iliac region, some enlargement of the spleen, perhaps slight delirium at night, and some bronchitis. (3) A period of continued pyrexia (fever) in which the temperature ceases to rise, and in which its daily variations are less. This period (astutium) lasts for a week or two. The want of appetite, thirst, dry tongue, frequent pulse, headache, and bronchitis continue or are increased. The tympanitic splenic enlargement, and delirium become more pronounced. Three or four soft yellow stools are passed daily. About the beginning of this period an eruption of small, pink, slightly raised spots appears on the skin, especially of the back and abdomen. (4) A period of defervescence, in which the fever gradually disappears and all the symptoms improve. This may last about a week. Cases vary much from this typical progress, and may be marked in addition by intestinal hemorrhage, perforation of the intestinal wall with collapse and peritonitis thrombosis of the larger veins especially the femoral, pneumoemia, lobular and (rarely) lobal, or meningitis. Relapses (after a normal temperature has been reached and recrudescence (before the fever has entirely disappeared) are not very uncommon. The mortality varies, but the average of recent reports is not far from 10 per cent. The anatomical features are inflammation of Peyer's patches and of the solitary glands of the small and sometimes of the large intestine, with inflammation of the mesenteric lymphatic glands. Persons between fifteen and thirty years of age seem to be most frequently attacked. A previous attack produces a certain but not complete protection. The contagium seems to be given off from the sick mainly by the stools. The contamination of food and drink seems to be the most important mode of infection. Personal contact does not materially increase exposure. Typhoid fever is now believed to be caused by a microscopic parasitic organism or bacillus, in length about one third the diameter of a red blood-corpuscle, in thickness about one third of its length, with rounded ends, middle forming spores at a temperature between 70 and 100° C., but not at lower temperatures, and forming minute brownish yellow colonies on gelatin, which it does not soften. For synonyms, see phrases above.—*Typhomalarial fever*, a febrile disease produced by the simultaneous action of the typhoid and malarial poisons. The term more often indicates a doubt whether the case is malarial or typhoid.—*Typhus fever*, a contagious fever, which in typical cases presents the following features: A period of incubation of nine days or more, a sudden onset of fever, often with a chill, a period of continued fever with pains in the head, back, and limbs, dizziness, noise in the ears, frequent bronchitis, and enlarged spleen. An eruption appears on the third to the seventh day, in the form of small red spots, usually abundant over the trunk and limbs, which in two or three days may become hemorrhagic. In the second or third week the disease may terminate by a fall of temperature, which is usually quite rapid. Relapses are very rare. The mortality varies in different epidemics from 6 to 20 per cent. The most susceptible years are between the ages of twenty and forty. One attack affords considerable protection against a second. For synonyms, see phrases above.—*Urethral fever*, fever ensuing on an operation on the urethra such as passing a catheter.—*Yellow fever*, an infectious disease of warm climates, typical cases of which present the following features: After a period of incubation varying from a day to several weeks, the invasion begins suddenly with headache, pains in back and limbs, often distinct chill nausea, often vomiting, inactivity, bowels, fever (pyrexia) usually high, a pulse rate less than corresponds to the pyrexia, sometimes vertigo, cataplexis, delirium, and albuminuria. Following upon these symptoms, often after a lull and apparent beginning of recovery, may come exhaustion of the heart and nervous centers, bleeding from mucous membranes (giving rise to black vomit), jaundic scanty urine, and albuminuria. The mortality in the latter class of private cases varies in the experience of different observers from 7 to 10 per cent. The autopsy reveals, in addition to the hemorrhagic congestion of the nervous centers, hypostatic congestion of the lungs, fatty degeneration of the heart and liver, and parenchymatous nephritis. The infectious principle of the disease has been identified with various micro-organisms, and is probably a plasmodium-producing bacillus. It is to be noted. In its spread from place to place human intercourse seems to be the efficient factor. It may be carried in clothes and other goods. Its development is favored by filth and repressed by cold. Individuals are infected by being in an infected locality. Personal contact with the

sick does not seem to greatly enhance the exposure. Its infection of food and drink is unavailing as a preventive measure. Whites are more susceptible to the disease than blacks, new-comers than old inhabitants. A previous attack usually produces immunity. Geographically it occurs in the warmer parts of America (though it has been known as far north as Portland in Maine) and in some parts of the old world.—*Yellow remittent fever*, ardent continued fever. (See also *brain fever*, *heat fever*, *hill-fever*, *hospital fever*, *jail fever*, *jungle fever*, *lake fever*, *ship fever*.)

2. In a collective sense, a filamentous substance; a conglomeration of thread-like tissues, such as exists in animals and plants generally; more generally, any natural, vegetable, or even mineral substance the constituent parts of which may be separated into or used to form threads for textile fabrics or the like: as, muscular or vegetable *fiber*; the *fiber* of wool; silk, cotton, or jute *fiber*; asbestos *fiber*.—3. See *cut* under *muscular*. (b) Fibrous tissue in general. Arciform fibers, arcuate fibers, collateral fibers, elastic fibers, etc. See the subject in v. —Fibers of Corti, minute rod-like bodies organized from the epithelial lining of the canals of the cochlea, resting upon the basilar membrane which separates the cochlear duct from the scala tympani, and forming an essential part of the organ of hearing. fiber without transverse striations, in distinction from striated fibers, which compose the voluntary muscles and the heart. —Sharpey's fibers, or perforating roots of Sharpey, very fine processes passing through and seeming to rivet together several concentric laminae of bone-tissue; perforating fibers. —Smooth fiber, the non-striated fiber of muscles. —Striated fiber, in anat., a muscular fiber. See *non-striated fiber*. —Vegetable fibers, the narrow elongated cells which characterize the woody and bast tissues of plants, giving them strength, toughness, and elasticity. Bast or fiber fibers, which are found chiefly in the bark, are distinguished from wood fibers by being usually longer, thicker-walled, and tougher. The cells are spindle-shaped with pointed ends, and cohere firmly to each other by the extremities, forming most of the textile fibers in common use. The length of the individual cells varies greatly, from less than a millimeter in many plants to an inch or two in hemp or flax, and from 3 to 6 or 8 inches or more in ramie or china-grass fiber. (See *cut* under *bast*.) The so-called fibers of cotton and similar material which are found investing seeds are in reality hairs, and not proper fibers. —Vulcanized fiber, paper, paper-pulp, or other preparation of vegetable fiber saturated and coated with a metallic chloride, as tin, calcium, magnesium, or aluminum chloride, with the effect of giving to the material toughness and strength. E. H. Knight.

What he [one of the "Lump People"] wants is a place where he is not obliged to depend on himself, where he has to do a fixed amount of work for a fixed amount of salary, and where his *fiberless* plasticity may find a mould ready formed, into which it may run without the necessity of being shaped for itself.

4. In *literature*: (a) A prose work (not dramatic) of the imagination in narrative form; a story; a novel.

One important rule belongs to the composition of a fiction, which I suppose the writers of fiction seldom think of, viz., never to fabricate or introduce a character to whom greater talents or wisdom is attributed than the author himself possesses, if he does, how shall this character be sustained?

J. Foster, in Exeter, p. 241.

(b) Collectively, literature consisting of imaginative narration; story-telling.

No kind of literature is so attractive as fiction.

Quarterly Rev.

The only work of fiction, in all probability, with which he (Bunyan) could compare his pilgrim, was his old favourite, the legend of Sir Bevis of Southampton. . . . He saw that, in employing fiction to make truth clear and goodness attractive, he was only following the example which every Christian ought to propose to himself. *Macaulay, Bunyan*.

(c) In a wide sense, not now current, any literary product of the imagination, whether in prose or verse, or in a narrative or dramatic form, or such works collectively.—5. In law, the intentional assuming as a fact of what is not such (the truth of the matter not being considered), for the purpose of administering justice without contravening settled rules or making apparent exceptions; a legal device for reforming or extending the application of the law without appearing to alter the law itself. Inasmuch as the courts cannot alter the law, but only declare it and apply it to facts as established by them, it was early discovered that the only way in which they could adapt the law to hard cases or stretch it to new cases, was by pretending a state of facts to fit the rule of law it was thought just to apply. Thus it was a rule of law that a deed takes effect from delivery, and the courts had no power to alter this rule, but if a grantor fraudulently or negligently delayed delivering his deed at the time it bore date, and afterward sought to claim some unjust advantage, as having continued to be owner meanwhile, the courts, not being able to change the rule of law, would by a fiction treat the delivery as relating back to the date. So, when legislation forbade transfers of land unless made publicly by record, the courts allowed an intending grantee to sue, alleging that the land belonged to him, and the intending grantor to suffer judgment to pass, thus by a fiction creating a mode of conveyance which, for all practical purposes, preserved the privacy of titles. Direct methods of improving the rules and forms of law have in recent times superseded the invention, and for the most part the use, of fictions.

I employ the expression "Legal Fiction" to signify any assumption which conceals, or affects to conceal, the fact that a rule of law has undergone alteration, its letter remaining unaltered, its operation being modified.

Macaulay, *Elements of Law*, p. 20.

Ficus (fik-us), *n.* [*L.*, a fig-tree, a fig; see *fig*.] 1. In bot., a very large genus of tropical and subtropical trees or shrubs, of the urticaceous tribe *Arctocarpeæ*, characterized by bearing their minute unisexual flowers within a nearly closed globose or pear-shaped receptacle. The genus is remarkable for the peculiar arrangement by which cross fertilization is effected through the agency of insects.

There are always three forms of flowers, the staminate, the pistillate, and a third, the gall flower, which resembles the pistillate but is incapable of fertilization, and is usually occupied by the pupa of a species of *Homoptera* or other hymenopterous insect. In a large group of species the three forms are found within the same receptacle, but in much the larger number, as in the common fig, the female flowers are in one receptacle and the male and gall flowers together in another. The perfect insect is formed synchronously with the maturity of the pollen of the male flowers, through which it makes its way and escapes by a perforation made at the apex of the receptacle. In what way it conveys the pollen to the pistillate flowers in the closed female receptacle is not understood, but it is believed that it is done, and that by this means only the female flowers are fertilized. Generally the laxenoid fertile receptacles are upon the same tree and are similar in appearance, but in the common fig they are upon separate trees, and differ so much in form that the sterile, known as the wild fig or capfig, has been considered by many botanists as a species distinct from the other. There are about one species, the greater number belonging to the islands of the Indian and Pacific oceans, though there are many in tropical America. Three or four species are found in Florida. The genus includes the common fig (*F. Carica*), the banian (*F. religiosa*), the India-rubber tree (*F. elastica*) etc. The wood is generally soft and valueless. See *fig*, and cut under *banian*.

It is possible that the *ML. vitula* is an accom. form of the Teut. word; cf. *L.L. harpa*, *It. arpa*, *F. harpe*, etc., harp, of Teut. origin. Another derivation, *< L. fidicula*, commonly pl. *fidicula*, a small stringed instrument, a small lute or cithern (dim. of *fides*, a stringed instrument, a lute, lyre, cithern), hardly agrees with the Teut. and not at all with the Rom. forms.] 1. Fifish (fi'fish), *a.* [See, < *Fife* + *-ish*.] "The term, it is said, had its origin from a number of the principal families in the county of Fife having at least a bow in their honours" (Jumieson), i. e., being deranged. The earliest form of the name of *Fife* was *Fif*; it is said to be a Jutland word (*fibb*) meaning a forest. Exceedingly whimsical; crabbed and peculiar in disposition; cranky in a manner once considered characteristic of Pifeshire in Scotland.

He will be as wowl as ever his father was. To guide in that gate a bargain that cost him four dollars. Very, very *Fifish*, as the east-country fisher folks say. *Scott*, *Pinale*, ix.

When a fifteenth was the rate for the counts at large, that for towns and demesnes was usually a tenth.

In 1334 the old system of grants of fractional parts of movables, *quinties* and *tenths* had been relinquished, and in lieu thereof a practice was adopted of granting a sum of money, to be partitioned out between the various counties and towns as for a *quint* and *tenth*.

This kingdom was to be the fifth and last in the series of which those of Assyria, Persia, Greece, and Rome were the pre-

ceding four; hence their self-assumed title. They unsuccessfully attempted risings against the government in 1657 and 1661.

Our vicar, from John 18. v. 36, declaim'd against ye folly of a sort of enthusiasts and desperate zealots, call'd ye Fifth Monarchy-Men, pretending to set up the kingdom of Christ with the sword. *Keelyn*, *Mary*, Aug. 10, 1667.

(d) In a scale, the fifth tone from the bottom; the dominant: solmized sol, as G in the scale of C, or E in that of A. The typical interval of the fifth is that between the first and fifth tones of a diatonic scale, acoustically represented by the ratio 3:2, and equal to three diatonic steps and a half. Such a fifth is called *perfect* or *major*; a fifth a half step shorter is called *diminished* or *minor*; a fifth a half step longer is called *augmented*, *superfluous*, or *extreme*. The perfect fifth is the next most perfect consonance after the octave. In harmony the parallel motion of two voices in perfect fifths is forbidden; such fifths are often called *consecutive fifths*, or simply *consecutives*.

As if a musician should insist on having nothing but perfect chords and simple melodic lines, no diminished fifths, no flat sevenths, no flourishes on any account.

O. W. Holmes, *Autocrat*, II.

3. In early Eng. law, a fifth part of the rents of the year, or of movables, or both, granted or levied by way of tax. — **Defective fifth**. See *defective*. — **False fifth**, in music, a diminished fifth. — **Hidden fifths**, in music, the consecutive fifths that are suggested when two voices proceed in similar (not parallel) motion to a perfect fifth. (See fig. 1.) The objection to this kind of progression becomes evident when the intermediate tones through which the skipping voice virtually passes are filled in. (See fig. 2.) Hidden fifths are forbidden in strict counterpoint, and discountenanced in simple harmony, particularly if both voices skip. Compare *hidden octaves*.

warm temperate countries. It is a small tree, with large, rough, deciduous leaves, and a pyriform fruit, which varies much in size, color, and flavor, and of which two crops are usually borne each season. This fruit consists of a hollow, fleshy receptacle filled with a multitude of minute seeds, or so-called acorns, the ripened ovaries of the pistillate flowers which covered the interior. When green the fig has a milky, acrid juice, which becomes sweet and mucilaginous at maturity. The Turkey or Smyrna figs of commerce, which are the most esteemed, are large and pulpy. A superior quality of these are known as *clones* *figs* (Turkish *elime*, hand-picked). What are called Greek figs are small and dry.

figure-casting (fig'ur-kas'ting), *n.* The art of preparing casts of human or animal forms and of various other complex objects. A figure is most accurately formed in wax, clay, plaster, or other suitable material, which serves as the core. If the core is friable, or can be reduced to ashes, the mold is formed directly upon the core, and when it is perfectly dry and hard it is exposed to a heat sufficient to melt or incinerate the core, the removal of which leaves a cavity for the mold of the cast. This method gives a solid casting, and is therefore suitable for small work only; moreover, the model itself is destroyed by one use. Replicable casts of natural objects are made in this manner. If the core cannot be removed in the way mentioned, the mold itself is made in parts to permit its removal.

Tanagra figurine, in archaeol., one of the small terracotta figures of divinities, of mortals, or of animals, found in various quantity and perfection throughout Greek lands.

These figures were in great demand among the Greeks as household ornaments, and it was usual to present them as offerings in temples, and to bury several of them with a

dead body. They were, as a rule, cast in molds and then finished, often very delicately, by hand, and after the baking they were brilliantly colored. In them is preserved a charming memorial of Greek private life in its various phases, such as the games of the children and the occupations of the women. They are commonly known as *Tanagra figurines*, because those first brought into public notice, as well as some of the most beautiful examples since found, come from the cemetery of Tanagra in Boeotia.

Alibuster (*al'i-bus-tér*), *n.* [*Sp. Alibustero (with inserted i in first syllable) = It. Alibustiere; < F. Alibustier, earlier Alibustier, a Alibustier, buccaneer, freebooter (with a inserted, but orig. not pronounced — a common fact in 17th century F., after the analogy of words in which an original s was retained in spelling, though it had become silent in pronunciation); < D. vrybutter (Kilian, 1598), now vrybutter, a freebooter, = E. freebooter = Dan. vrybutter = Sw. vrybutter = G. freibutter (the E., Dan., Sw., and G. words being not independent formations, but formed after the analogy of the D. vrybutter, which appears to be the oldest form). In a Dutch work ('De Ameriësche Zee-Roovers,' 1678) written by a buccaneer named John Oxmelin, otherwise Exquemelin or Esquemeling, and translated into French and Spanish, and subsequently into English (1684), the adventures of the West Indies are said to have been divided into three classes — the buccaneers (buccaneers) or hunters (see buccaneer), the Alibusters (Alibusters) or rovers, and the farmers (chabans); and the Alibusters are said to have assumed their name 'from the English word Alibuster, which means rover'; this must refer to E. freebooter, but the D. form appears to be the original. The buccaneers consisted mainly of French, Dutch, and English adventurers, and not to any extent of Spaniards, with whom they were constantly at war; the Sp. form Alibusters can only be an accom. of the F. Alibustier; the s is now pronounced in F., etc., because, as now used, it is taken from the books, as spelled. The commonly assumed connection with E. flybust (Sp. flybuste, Alibuste, F. flybot, < D. vryboot; see flyboat) has no support either in history, a name distinctively applied to the West*

Indian bucaneros or pirates of the seventeenth century. See *buccaner*. Hence—2. One of a band of men organized, in disregard of international law, for the purpose of invading and revolutionizing a foreign state. Specifically applied in history to the members of certain expeditions which in the middle of the nineteenth century originated in or set out from the United States against certain Spanish American countries for the purpose of revolutionizing them. The principal of these expeditions were those led by Narciso López from New Orleans against Cuba, in 1850-51, and those by William Walker from California against the Mexican state of Sonora in 1853-54, and against Nicaragua in 1855-58. Both leaders were captured and put to death, the latter after having succeeded in his second object and exercised sovereign power for some time over Nicaragua. Hence—3. In a legislative or other deliberative body, a member in the minority who resorts to irregular or obstructive tactics to prevent the adoption of a measure or procedure which is favored by the majority. = Sp. Pg. *filtro* = It. *feltro*, felt. (ML. *feltum*, *feltum*, felt; see *felt*, and cf. *feltier*, *feltier*.)

1. A device for arresting and separating any matter mechanically suspended in a liquid. Filters used in the processes of analytical chemistry are made of paper or asbestos. The filter-paper is bibulous, consisting of nearly pure cellulose, with only bare traces of mineral matter. Many precipitates are more conveniently separated by an asbestos filter, the most common form consisting of an ordinary platinum crucible having the bottom perforated with fine holes which are covered with a thin asbestos felt. In the arts filters are used to purify water, syrups, vinegar, the juices of cane and fruits, oils, liquors, sewage, liquid by products, and molten metals. The materials used in filtration are gravel, sand, charcoal, bone-black, sponge, fabrica, woven wire netting, asbestos, porous brick and stone, mineral wool, rope, paper, and powdered glass. The devices used to hold the straining material are in a great variety of forms, from a simple wick or hose cloth hung over the edge of a bowl of water and acting as a capillary strainer, to a settling pond filtering 400,000 gallons of water in a day. The most common filter is a cone of bibulous paper, or a square of cloth sewed together to form a bag (called *Hippocrates's cone*). Filters also consist of porous brick or stone (asbestos), or tubes filled with sponge, charcoal, or sand, etc. Domestic filters are used in connection with pumps and water faucets. To cause the liquid to pass through a filter, the weight of a column of water, the pressure of the atmosphere, mechanical force from a screw or from steam-pressure, and centrifugal force are employed, as in the *centrifugal filter*, *oil filter*, *vacuum filter*, and many forms of pressure filters. Filters are also made reversible and intermittent, so that the filtering material may be freed from the collected sediment. In some pressure filters the liquid or syrup is within a cylinder, and is forced outward through rings of fabric under steam-pressure; in others it is forced through a series of strainers piled one above another. Where bone black and charcoal are used, there is also a filtering or straining of a certain amount of gas and organic material that would pass through any other filter without detention. Filters are also used to remove dust and floating matter from air, but such devices are more properly termed *air strainers*.

Having for trial sake filtered it through cap paper, there remained in the *filter* a powder of a very deep and lovely colour.

finite (fi'nit), *a.* and *n.* [*Fr. finit* = *Sp. fin*, *It. finito*, < *L. finitus*, pp. of *finire*, end, complete, finish: see *finis*.] *1. a.* 1. Not too great nor too small to be naturally susceptible of measurement, whether measurable by us or not; not infinite nor infinitesimal. All objects of ordinary experience are finite; e.g., eternity, immensity, and the like are not finite. *Philosophically*, *finite* means having an end or terminal; but this significance is not coextensive with the English use of the term. Thus, the circumference of a circle has no ends, yet is finite, while past time has an end, yet is not finite. So, if a finite are be cut out of a parabola, what remains has two ends, yet is not finite.

The obvious portions of extension that affect our senses carry with them into the mind the idea of *finite*; and the ordinary periods of succession whereby we measure time and duration, as hours, days, and years, are bounded lengths. *Locke, Human Understanding, II. xvii. 2.*

The following are the special significations of the word: (a) As applied to a class or integer number, capable of being completely counted: this is the fundamental meaning. This distinction between a finite and an infinite class is very important, because there is a peculiar mode of reasoning, called by logicians reasoning by transposed quantity, which is applicable to finite classes alone. The following syllogism is an example: "Every Hottentot kills a Hottentot, but no Hottentot is killed by more than one Hottentot; hence, every Hottentot is killed by a Hottentot." If by the Hottentots is here meant a class of which a complete census might be taken, this conclusion must be true, provided the premises are true. But if the generations of Hottentots are everlasting, each Hottentot might kill one of his children, and yet some Hottentots might die natural deaths. It is according to transposed quantity is inapplicable in the higher arithmetic and algebra; and consequently in these branches of mathematics the distinction between finite and infinite classes is very important. (b) As applied to continuous quantity, smaller than a suitably chosen finite number multiplied into the unit of measurement, and larger than a suitably chosen finite number divided by the unit of measurement.

When the alarm circuits are only to the engine houses it is called a *street-alarm system*; to distinguish it from a system where large bells are rung to inform the public of the location of a fire. Explosion takes place when as is often the case, the gas given off by the coal consists largely of marsh gas (light carbonated hydrogen). The composition of the gas evolved from coal is, however, very variable; in connection with the marsh gas, oxygen, carbonic acid, and nitrogen seem to be always present. Fire-damp is a source of great danger to life in coal mines. See *damp*.

Watt, quoted in *Lancet*, July, XXII, 45.

2. An engine designed to throw a continuous stream of water through a hose upon a conflagration, for the purpose of extinguishing it.

Fire engine

Fire-engines are of three principal kinds: *hand power*, *steam*, and *chemical*, according to the power employed. Hand power fire engines consist in the motion of a pair of single acting force pumps, mounted on wheels, and worked by hand. They have been generally superseded by the application of steam. Steam fire engines consist essentially of a pair of single acting suction and force pumps operated by steam, the whole apparatus being mounted on wheels and drawn by horses or a motive self propelled. The chemical fire engine is a large form of fire extinguisher mounted on wheels and drawn by horses. Floating fire-boats and steam fire engines are used in large ports, for the protection of shipping and the water fronts.

fire-escape (fir'es-kap'), *n.* Any apparatus or structure designed to enable persons to escape from the upper windows of a building in case of fire. Portable fire-escapes consist generally of ladders, often mounted on wheels for ease in transportation, and capable of being extended like a telescope. Permanent fire-escapes consist usually of light iron ladders and hand-ropes attached to the outside of a building.

fire-extinguisher (fir'ek-sing'ish-er), *n.* An apparatus designed for immediate and temporary use in putting out a conflagration by means of a small stream of water or of water mingled with carbonic acid gas. In the commonest form water is placed in a metal holder or vessel, and above it, within the holder, is placed a smaller vessel containing a chemical, as sulphuric acid, that may be set free by the turning of a handle or key on the outside of the apparatus. Another chemical, commonly sodium bicarbonate, is also placed in the apparatus. When the acid is set free it combines with the sodium, setting free carbonic acid gas, which, by its pressure, escapes when a nozzle is opened, carrying the water with it in a strong stream. Such extinguishers are usually made portable, to be carried in the hand or upon the back, and are mounted upon a light truck to be drawn by horses. But they are also made in heavier forms, when they are commonly called *chemical fire-engines*.

Its larva lives in the ground, feeding on earthworms and soft bodied insects, and transforms to the pupa in an oval cell in June, hatching as a beetle ten days later. In the genus *Photinus* the larva is luminous. The larger tropical fireflies belong to the elaterid genus *Pyrophorus*, and are known as *carabids*. One of the most brilliant is *P. noctuicus* of South America and the West Indies, emitting such luminosity from two eye-like spots.

Wood is best protected by silicate of soda, which on the application of strong heat fuses into a glass, and not only envelops the outside, but also filling the internal pores of the wood, shields it from contact with the oxygen of the air. E. B. Tyler, Early History of Mankind, p. 202.
fire-stone (fir'stön), *n.* [*ME. fyrstene*, *AS. fyrstan* (= *Old. cverstein*, *D. cverstein* = *MLA. cversten*, *L.G. fjersten* = *G. feuerstein* = *Dan. fyrsten*), flint, *fyr*, fire, + *stan*, stone.] 1. A flint used with a steel for striking fire.

2. A contrivance of inflammable and explosive materials combined in various proportions, for the purpose of producing in combustion beau-

tiful or amusing scenic effects, or to be used as a night signal on land or sea, or for various purposes in war; commonly used in the plural. The basis of these compositions consists of potassium chlorate, nitre, sulphur, and charcoal pulverized, and combined in different proportions with other agents which have the quality of imparting color to the flame, as with copper sulphate for blue, strontium nitrate or carbonate for red, potassium salts for violet, sodium salts for yellow, barium carbonate or nitrate for green, and with iron and steel filings to produce brilliant scintillations. These compositions are packed in cases of paper and pasteboard, generally cylindrical, the processes of packing and finishing demanding much skill and care. For scenic displays, the forms of fireworks most in use are the *grand fire*, such as theater-fires, lanterns, and gerbes, *rocket-fires*, as pin or catamaran wheels, spiral wheels, etc.; *ascending fires*, as sky-rockets and greenwhips, Roman candles, etc.

As night signals or as incendiary projectiles, various pyrotechnic devices have been employed with success in military and naval operations. These devices consist of preparations used (1) in the service of cannon or cannon ammunition, such as slow-match, quick-match, friction, electric, and obliterating primers, port-fires, and fuses, (2) for signals, such as signal rockets, signal lights, blue lights, etc., with their decorative contrivances of stars, serpents, gold rain, rain of fire, and maroons; (3) for incendiary purposes, as the *caracass*, incendiary match, and fire stone, (4) for light, as tarred links, torches, light balls, fire balls, pitched fusinets, and parachute-shells, (5) for offensive and defensive purposes, as bags of powder, cataracts, projectile rockets, as those of Congreve and Hale, light batteries, and dynamite or ultralyserin catapults. The most familiar of the many forms of fireworks is the sky-rocket, whether employed as a signal or for mere display, or as a projectile in war. An important use of the rocket is that of a line carrier to establish communication between a wrecked vessel and the shore. The Chinese, if not the actual inventors of fireworks, were the first to use the rocket as a missile in war, and the pyrotechnic exhibitions of the Chinese and Japanese still surpass those of all other peoples in ingenuity and splendor. The Japanese have continued an exhibition of fireworks by daylight, consisting of bombs which, exploding high in air, discharge great volumes of colored smoke which take the forms of birds, fishes, trees, and even of human beings. Fireworks are supposed to have been introduced into Europe by the Italians. They are mentioned in a description of a pageant at the marriage of Henry VIII. and Anne Bolyn.

The king would have me present the princess . . . with some delightful ostentation, or show, of pageant, or simile, or fireworks. *Shak. I. I. 1.*, v. 1.

All the hummocks were taken down, our ordnance loaded, and our powder chests and *fireworks* made ready. *Wentworth, Hist. New England*, I. 7.

There was at night a show of very strange and sundry kinds of *fireworks*, composed by cunning to fly to and fro, and to mount very high into the air upward, and also to turn unquenchable in the water beneath. *Lancham, quoted in Strutt's Sports and Pastimes*, p. 400.

Fire workers are subordinate officers to the fire masters, who command the bombardiers. They receive the orders from the fire masters, and see that the bombardiers execute them. *Chambers's Cyc. (London, 1741)* quoted in *S. and Q.*, 7th ser., III. 476.

Fire worker of H. M. Office of Ordnance. S. and Q. 7th ser., III. 479.

fire-worm (fir'wërm), *n.* [*AS. MLA. vuurworm* = *G. feuerworm*.] A glow-worm.

I have seen the fire-flies and fire-worms. Inman, Calp., II. 1.

fire-worship (fir'wër'ship), *n.* The worship of fire, or of the god of fire, or of the divine as typified by fire; also, the ceremonial cult of a public or a family hearth, as practised, for instance, by all Aryan peoples, by all ancient Greek communities, by the vestal virgins of Rome, and in each ancient Greek and Roman family. The term *fire-worship* is specifically applied to the religion of the ancient Persians taught by Zoroaster, and practised by their descendants the Guebans and Parsis of Persia and India, in which latter a numerous derivation from the Mohandashians the fire being with these people merely a symbol of divinity and a visible sign of their religion. *See Guebans*, and *Parsis*.

Fire worship belongs into view again, though under different aspects and with different results, the problems presented by water-worship. The real and absolute worship of fire falls into great divisions: the first belonging rather to fetishism, the second to polytheism proper, and the two apparently representing earlier and later stages of theological ideas. *E. B. Tyler, Prim. Culture*, II. 251.

After *Samson*, *Mohand* and *Ammon*, both nations addicted to *fire-worship*, in *Chaldea*, showed no trace of reverence towards them. *Van Emden, Early Hist. (trans.)*, p. 47.

fire-worshiper (fir'wër'ship-ër), *n.* A worshiper of fire; specifically, a follower of Zoroaster. *See Guebans* and *Parsis*.

There has been an error in imagining that the Persians and the ancient *fire-worshipers* were idolaters simply of fire, inasmuch as in bowing down before it, they simply regarded fire as a symbol, or visible sign, or thing placed as standing for deity. *H. Jennings, Rudiments*, p. 79.

The so-called *fire-worshipers* certainly do not worship the fire, and they naturally object to a name which seems to place them on a level with mere idolaters.

Max Müller, Chips, I. 100.

[firmare, make strong, strengthen: see firm, v.]

2. The sky or heavens; the vault of heaven, viewed as something solid and abiding; the region of the air. [The Hebrew word *raquia*, which is so rendered in Scripture, conveys chiefly the idea of expansion, although that of solidity is also suggested, inasmuch as the root signification of the word is 'that which is expanded by beating out.' The English *firmament* is adopted from the Latin *firmamentum*, which is the equivalent of the Greek *στερεωμα*, *stereōma*, firm, solid, by which the writers of the Septuagint rendered *raquia*. Some old astronomers identified the firmament with the orb of the fixed stars; but the word never had any settled and exact meaning in astronomy.]

The difference between a *firman* and a Hatti Sherif is that, though both are edicts of the Turkish government, the former is signed by any Minister, whereas the latter is approved by the Sultan himself, with his special mark, and is therefore supposed to be less revocable. The distinction is as great as between a love letter and a marriage settlement. *Blackwell's Map.*

2. In phren., an organ situated toward the back part of the head, between self-esteem and veneration. Its function is said to be to produce determination, constancy, and perseverance. *< Syn. 1. Firmness, constancy, faithfulness, fidelity. Firmness* is a matter of the will preventing one from yielding. *Emerson* is of the belief holding one steadfast. *Firmness* is opposed to weakness of principle, constancy to fickleness. *Faithfulness* is a matter of the heart. It is generally a warmer sort of *firmness*, with the element of principle sometimes less prominent. *Fidelity* is a matter of personal principle; the word *firm* often implies the other applies to definite action. We speak of the *firmness* of a teacher in maintaining order, the *firmness* of a lover, the *fidelity* of a bank cashier, the *faithfulness* of a mother. We may speak of the *fidelity* of a dog only as he is to trusts reposed in him, or is considered as having the power to apply principle to action as a moral being. *See* *decision* and *assiduity*.

She now took her place among her pupils with an air of spirit and *firmness* which assured them at once that she meant to be obeyed, and obeyed she was. *Charlotte Brontë, The Professor, xviii.*

FIG. 10. *Fissurella testis*

Fissurellidae (fis'ū-re-lā'id-ē), n. pl. [NL., < *Fissurella* + -idae.] A family of scaphobranchiate promobranchiate gastropod mollusks; the keyhole-limpets. They resemble ordinary limpets in appearance and habits, but differ much in structure. The shell is perforate or emarginate and sometimes proportionately small for the size of the animal. There are many species, extinct and extant. Also *Fissurellacea*.

The *Fissurellidae* are structurally closely allied to the *Patellidae*, but in external appearance they are very different. The shell is conical, and shows but very slightly any spiral. The series of openings of the *Fissurella* are replaced by a hole at or near the apex of the shell, or by a notch in the front margin. On the inside of the shell is a horseshoe-shaped impression, indicating the surface of attachment of the muscles of the foot. The eyes, instead of being placed on stalks, are scarcely elevated above the surrounding surface. The species are largely inhabitants of the warmer seas of the globe, although some forms are boreal in their range. They are mostly found near the shores, where they feed on the small seaweeds. In their habits they are not different from other limpets. *Stand Nat Hist*, I, 320.

"flagma," *< √ flag* in *flagrare*, burn, blaze; see *flagrant*. Cf. *phlegm* (formerly also *flam*, etc.).] 1. A blaze; vapor in combustion; hydrogen or any inflammable gas in a state of visible combustion. Flame is attended with great heat and generally with the evolution of much light; but the temperature may be intense when the light is feeble, as is the case with the flame of burning hydrogen gas. The flame of a burning body, as of a candle, may be divided into three zones, an inner zone, containing chiefly unburned gas, a central, containing partially burned gas; and an outer, in which the gas is completely consumed by combination with the oxygen of the air. The luminosity of flame depends upon the presence of solid matter or of dense gaseous products of combustion. The *concentric flame* (as of a blowpipe) is that part of the flame which is deficient in oxygen for combustion (cf. figure), and which has therefore a reducing effect or, in other words, tends to deprive the substance under examination of oxygen; the *oxidizing flame* is that part (cf. figure) in which the oxygen is in excess, and which exerts the opposite or oxidizing effect. The distinction is important in blowpipe analysis.

Order of the Golden Fleece, an order founded by Philip the Good, Duke of Burgundy, in 1430, on the occasion of his marriage with the Infanta Isabella of Portugal. The office of grand master passed to the house of Hapsburg in 1477 with the acquisition of the Burgundian dominions, which included the Netherlands. After the time of the emperor Charles V. (died 1558) this office was exercised by the Spanish kings, but after the cession of the Spanish Netherlands to Austria the latter power in 1715 again claimed the office. The dispute remains undecided, and the order therefore exists independently in Austria and in Spain. The badge of the order is a golden ram pendant by a ring which passes round its middle. This hangs from a jewel of elaborate design, with enamelling of several colors, various suggestive device; and the motto "Proletum laborum non vili."

A form of silica, somewhat allied to chalcedony, but more opaque, and with less luster. It is usually of a light gray or brownish color. It has a peculiarly well marked conchoidal fracture, and can easily be broken up into fragments having sharp cutting edges. For this reason, and because of its hardness, which is proverbial, flint was most extensively used in prehistoric times for all kinds of cutting implements. The use of flint as a means of striking fire with a steel, and especially as a part of the one almost universally used musket-lock, is well known. Flint occurs in large quantity in the form of nodules, and even sheets or beds, in the chalk of England and France, and has been formed by the slow replacement of carbonate of lime by silica held in solution in water. It is abundant in the United States, generally in massive forms. The exterior of most flints is of a lighter color than the interior, this difference being caused by a rearrangement of the particles of the silica.

They consist of arrow-heads, ax-heads or celts, lance-heads, knives, wedges, etc. Flint implements have been found in many regions of the globe; often, as in the Somme valley in France, in apparently upheaved beds of drift, and in connection with the remains of extinct species of the elephant, rhinoceros, and other mammals, whence man's existence on the globe at a geological period anterior to the present has been inferred. Flint implements are still used by some savage tribes.

flint-glass (flint'glās), *n.* A variety of glass in which the silica is combined with oxid of lead in greater or less quantity. The larger the amount of lead the higher the specific gravity and the refractive power, and the greater the brilliancy of the product. Flint-glass is often called *crystal glass*, or simply *crystal*, while some limit the name *flint glass* to the variety specially made for optical purposes. Besides the oxid of lead, potash is an essential ingredient of flint-glass or crystal. Analyses of different kinds of crystal show the presence of from 28 to 37 per cent of oxid of lead, 11 to 17 of potash, and 62 to 50 of silica. The flint glass of Oldmund, used for optical purposes and generally admitted to be of unrivalled excellence, contains about 43 per cent of oxid of lead and 12 of potash. The brilliancy of crystal glass fits it for use for ornamental purposes, and especially for the most showy and expensive table ware. The characteristic luster and sparkle due to the high refractive power of the material is brought out by cutting and polishing, exactly as is done in the case of gems. Owing, however, to its softness, crystal glass is easily scratched by careless handling and dulled by wear. The name *flint-glass* originated in the fact that the silica first used in England for the manufacture of this article was derived from flint. An essential requisite for good flint glass is purity of the materials employed, and the form of the furnace and of the melting pots are peculiar. Great technical skill is required for the production of the best kind of glass for optical purposes. See *glass*, *stain*, and *lens*.

I assailed at the birth of that most significant word *firtation*, which dropped from the most beautiful mouth in the world, and which has since received the sanction of our most accurate Laureate in one of his comedies. Some inattentive and unbecoming people have, I know, taken it to be a term synonymous with coquetry; but I lay hold of this opportunity to undeceive them, and eventually to inform Mr. Johnson that *firtation* is short of coquetry, and intimates only the first hints of approximation, which subsequent coquetry may reduce to those preliminary articles that commonly end in a definite treaty.
Chesterfield, quoted in *Brit. Essayists*, cl. 210.

view the use in Phier's *Virgil* (see extract un-
der def. 2); but such a corruption of an estab-

is scarcely possible; Phier's *flu*, if not a mis-

fluophosphate (flū-ō-fos'fāt), *n.* [Short for "fluophosphate," *L. fluor* + *phosphate*.] In mineralogy, a phosphate containing fluorine as an essential part. For example, the mineral wagnerite is a fluophosphate, the formula being $(\text{Fluor } \text{Mg}_2\text{P}_2\text{O}_8 \cdot 2\text{H}_2\text{O})$. The precise part played by fluorine in the chemical combination may be open to question.

fluor (flū'or), *n.* [*L. flum*, a flow, a flux, *L. fluere*, to flow; see *fluent*.] 1. A liquid state.—2. Menstrual flux.—3. In mineralogy, fluor-spar.

Fluor albus (literally, white flux) in *pathol.* a white or leucorrhœa.

Many beautiful effects are produced by blowing tubes in uranium glass, which *fluoresces* with a fine green light.

S. P. Thompson, Elect. and Mag., p. 216.

The ultra-violet rays of the spectrum can be seen without the intervention of any *fluorescing* substance through a glass.

Loomet, Light (trans.), p. 186.

fluorescein (flū-ō-rēs'fīn), *n.* [*L. fluoresce* + *-in*.] The anhydride of resorcin phthalin, $\text{C}_{20}\text{H}_{12}\text{O}_5$. It is a coal-tar product, but is little used in dyeing. From it are derived the eosins.

Fluor green, some of the Eosins, Madder-red and Resorcin blue also show a marked fluorescence when in solution.

Benedict, Coal-tar Colours (trans.), p. 25.

fluorescence (flū-ō-rēs'fēns), *n.* [= *F. fluoresce* + *-ence*.] The property possessed by some transparent substances of becoming self-luminous while they are exposed to the direct action of light-rays. See *phosphorescence*. It is especially excited by the violet and ultra-violet rays of the spectrum, and is explained by the change in refrangibility (that is, wavelength) of the incident rays by the substance under experiment. Thus if a beam of sunlight fall upon a solution of caustic or sulphate of quinine, its path through

the liquid is marked by a bluish opalescent light. Again, if a paper moistened with the solution is exposed to the ultra-violet rays of the spectrum, it becomes blue, since these rays are diminished in refrangibility so as to become visible; by this means the ultra-violet spectrum (given by prisms of quartz) can be studied. The delicate blue surface color of some fluor-spar and the yellowish-green surface color of glass colored with uranium oxide (canary glass) are phenomena of the same nature. For some years previous to 1852 the phenomenon was termed *crystallo dispersion*.

fluorescent (flū-ō-rēs'ent), *a.* [= *F. fluoresce* + *-ent*.] Possessing the property of fluorescence; exhibiting fluorescence.—**Fluorescent eyepiece**, a form of eyepiece, as that of Soré, used with the spectroscopy in examining the ultra violet spectrum made visible by fluorescence.

fluorhydric (flū-ō-rī'drīk), *a.* Same as *hydrofluoric*.

fluoric (flū-ō-rīk), *a.* [*L. fluo* + *-ic*.] Pertaining to or obtained from fluor (fluor-spar).—**Fluoric acid**. See *hydrofluoric acid*, under *hydrofluoric*.

fluoride (flū'ō-rīd or -rīd), *n.* [*L. fluo* + *-ide*.] In chem., a compound of fluorine with another element.

fluorine, fluorine (flū'ō-rīn), *n.* [*L. fluo* + *-ine*.] Chemical symbol, F; atomic weight, 19.05. A gaseous element, not known in a free state, since its isolation is a matter of great difficulty and of some doubt. It forms with other elements a group of compounds called *fluorides*. The commonest of these is calcium fluoride, or fluor-spar. Fluorine occurs abundantly in the mineral kingdom, as in fluor-spar, cryolite, and other minerals, and also in minute quantity in the teeth and bones of animals.

fluorite (flū'ō-rīt), *n.* [*L. fluo* + *-ite*.] Same as *fluor-spar*.

fluoroid (flū'ō-rōid), *n.* [*L. fluo* + *-oid*.] In crystallography, a solid contained under twenty-four triangles; a tetrahedron (which see); so called because it is a frequent form in fluor-spar.

fluoroscope (flū'ō-rō-skōp), *n.* An apparatus designed for observing the effect of the Röntgen rays by means of their action on a fluorescent substance. It consists essentially of a tube or box closed at one end by a screen coated with a fluorescent substance, as tungstate of calcium. When an object, as the hand, placed before a vacuum-tube is observed through the fluoroscope, the shadows of its parts that are not transparent to the X rays are seen on the fluorescent screen.

fluorous (flū'ō-rūs), *a.* [*L. fluo* + *-ous*.] Obtained from or containing fluor-spar or fluorine.

fluor-spar (flū'ō-r-spār), *n.* [*L. fluo*, a flow, flux (see def.), + *spar*.] A common mineral, the fluoride of calcium, CaF_2 , found in great beauty in Derbyshire, England, and hence also called *Derbyshire spar*. It occurs both massive and crystallized, in simple forms of the isometric system, namely, the cube, octahedron, dodecahedron, etc., and in combinations of these. Pure fluor-spar contains 48.7 per cent. of fluorine and 51.3 of calcium. It is of frequent occurrence, especially in connection with iron taliferous beds, as of silver, tin, lead, and cobalt ores. It is sometimes colorless and transparent, but more frequently exhibits tints of yellow, green, blue, and red. From the general prevalence of a blue tint in the Derbyshire specimens, it is there known as *blue john*. It is often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases and occasionally used for beads, brooch stones, and other ornamental purposes, although it is of inferior hardness. Some varieties exhibit a bluish fluorescence, and all kinds phosphoresce on gentle heating, especially the variety chlorophane, which emits a beautiful green light. The name *fluor* has reference to its use as a flux to promote the fusion of certain refractory minerals. Also called *fluorite*.

fluosilicate (flū-ō-sīl'ī-kāt), *n.* [*L. fluosilic-ic* + *-ate*.] 1. In chem., a compound of fluosilicic acid with some base.—2. In mineralogy, a silicate containing fluorine as an essential part. See *fluophosphate*.

It may be obtained by applying a gentle heat to a mixture of one part of powdered fluor-spar, one of silica, and two of sulphuric acid, in a retort. It is a colorless, pungent, suffocating gas, which fumes when it escapes into humid air, and is rapidly decomposed by water.

fluotantallic (flū'ō-tan-tal'īk), *a.* [Short for "fluotantallic," *L. fluo* + *tantalum* + *-ic*.] Derived from fluorine and tantalum.—**Fluotantallic acid**, an acid obtained by treating tantalum with hydrofluoric acid.

fluotitanic (flū'ō-tī-tan'īk), *a.* [Short for "fluotitanic," *L. fluo* + *titanium* + *-ic*.] Obtained from titanium and fluorine.

flur, *n.* A Middle English form of *flower*, *flour*. **flur-bird** (flūr'bērd), *n.* [*L. flur* (origin unknown; cf. *E. dial. fluring*, a brood) + *bird*.] A decoy-bird. *Goldsmith*.

fluren, *v.* An obsolete form of *flourish*. **flurichet**, *n.* A Middle English form of *flourish*.

Surry (*Surry*), *v. i.* [Appar. a dial. var. of *surry* (M.E. *surren*, *surren*, *surren*), or of *surry* = *surry*; perhaps assimilated to *spurn*.] To sneer. [Prov. Eng.]

Give me leave to *surry* at them (abortive birth), as the poor exorcism of nature, which rather blench than adorn the structure of a well-composed body.

Pletcher, Poems, Pref.

The several words spelled *surry* being mostly dialectal, colloquial or technical, and scattered in early literature, have become partly confused with one another, and cannot now be entirely disentangled. Words originally different have a quired some meanings very nearly identical, while on the other hand there are some meanings not obviously related which are nevertheless to be referred to one original. The separation made in the following articles is based on the present differences of sense, and is probably more minute than the etymology if fully known, would require.

Sw. dial. *surra*, burn furiously, blaze, Norw. *surra*, passion, vehemence, eagerness, see further under *surry* and *surry*. In music, an instrument of the pipe kind, in which the tone is produced by the impact of a current of air upon the edge of a hole in the side of a tube. See *pipe*, *flte*. Flutes are either direct or transverse, the former (flute-a-bee) having a mouthpiece or whistle at the upper end of the tube, which is held straight away from the player's mouth, and the latter (transverse flutes) having a mouth hole in the side of the tube, which is held across the player's body. In both species finger-holes in the tube control the pitch of the tones; and in both increased force in blowing raises the pitch an octave. The exact explanation of the production of the tone is somewhat uncertain. It is asserted that the stream of air, being usually flat, acts like a free reed in the opening, playing back and forth like a solid tongue.

The change from the medieval direct flutes took place early in the eighteenth century. The best model for orchestral use was invented by Theobald Boehm in 1832. The piccolo-flute or piccolo is a flute giving tones an octave higher than the ordinary flute.

genus, and of the related genera *Haliargyreus* and *Parargyreus*, have been taken off the Atlantic coast of North America. There is also a large Californian species, *E. californicus*, some 16 or 17 inches long, which has been observed to take very long flights. See the extract.

The *fly-ing-fishes* proper, forming the subfamily of *Exocoetinae*, are distinguished (from other *exocoetids*) by the development of the pectorals, which are elongated and capable of considerable horizontal extension, so that the fish is buoyed up in the air, which it reaches by vigorous movements of its stout tail and caudal fin. . . . The species of the family are pelagic, and representatives are found in almost all the tropical and warm seas. They associate together in schools of considerable size. The aerial flight is not strictly entitled to the name, for the pectoral fins are not used in active progression, but are simply employed as para-hutes. . . . The fins are . . . more or less vibrated, but it is rather by an opposition to the air than by the volition of the animal.

1. focus, a fireplace, a hearth (ML. also the
seat or central point of a disease). Hence *ult.*
[< *L. focus*] *focill* = *fuscol* = *fues*, *fucose*,
fouage, *fuger*, *fuk*, etc.] 1. In *optics*, a point
at which rays of light that originally diverged
from one point meet again, at a point from
which they appear to proceed. The former is called
a *real*, the latter a *virtual focus*. The *principal focus* of a
lens is the focus of rays striking the lens parallel to its
axis. The *conjugate foci* of a mirror or lens are two points
so situated that the rays emitted from a luminous body at
either point are reflected (by the mirror) or refracted (by
the lens) to the other. See *conjugate mirror* (under *con-*
jugate), *lens*, and *mirror*.

A focus . . . may be defined as the point to which a
spherical wave converges, or from which it diverges. It
may also be defined as the point at which little waves
from all parts of a group wave arrive at the same time.
Airy, Optics, § 44.

Every lens which becomes thicker towards its periphery
has virtual foci; and vice versa, for the focus of a lens is to
be real, the lens must be thicker in the middle than at
the edge. *Loomes, Light* (trans.), p. 80.

2. In *geom.*, a point from which the distances
to any point of a given curve are in a *syzygetic*
relation. Thus, the sum of the distances of any point
of an ellipse from its foci is constant, and the difference
of the distances of any point of a hyperbola from its foci
is constant. A modern definition is that the foci are the
intersections of common tangents of the curve and the
absolute. In like manner, a focus of a surface is a point
on the curve of intersection of common tangent planes of
the surface and the absolute. See *cuts* under *Cartesian*
and *elliptic*.

3. In the theory of perspective, with reference
to two planes in perspective, one of four points
— two, *F₁* and *F₂*, on one plane, and two, *f₁* and
f₂, on the other — such that the angles between
two points on the first plane measured at *F₁*
are equal to the angles between the correspond-
ing points on the other plane measured at *f₁*,
and so with the pair of foci *F₂* and *f₂*. One
pair of foci are called *similar*, because the angles are mea-
sured in the same direction on the two planes; the other
pair are called *dissimilar*, because the angles are measured
in opposite directions.

4. Figuratively (with a consciousness of the
classical Latin meaning), a central or gather-
ing point, like the fire or hearth of a house-
hold; the point at or about which anything is
concentrated; a center of interest or attrac-
tion.

radiates. Mrs. Gaskell, *My Servant*, xiii.

Acoustic focus, a point to which sound-waves are con-
verged, as by reflection in the case of a room having an
ellipsoidal ceiling. — **Focus of mean motion**, the empty
focus of the orbit of a planetary body, so called because
when the orbit is nearly circular the planet describes in
equal times nearly equal angles about this focus as a ver-
tex. — **Focus of true motion**, that focus of the orbit of a
planetary body which is occupied by the central body. —
Heat-focus, the point to which the invisible heat-rays
are converged, as those from the sun by a convex lens.

In *focus*, situated or fixed at a focal point, or so as to
secure or exhibit a focal effect. said (1) of the condition
of an image projected by a lens, or seen through a lens,
when this image appears sharp and clearly defined; (2)
of the position of the lens with reference to a screen or
ground glass upon which such image is projected, or of
the position of the screen or ground glass with reference
to the lens; (3) of a photographic, positive or negative pic-
ture accurately produced by the agency of a lens.

While your head is still under the focusing-cloth, pass
your hand round to the lens, and move the rack backward
and forward till you find the point at which it is most
distinct. It is then said to be "in focus," or "sharp."

focusing-cloth (fō'kōng-ing-kloth), *n.* In *pho-
tog.*, a piece of opaque fabric, preferably of a
dark color, large enough to envelop the cam-
era and the head and shoulders of the oper-
ator, used in bringing a picture to focus to
render the image projected by the lens on the
ground glass distinctly visible by the exclusion
of other light than that passing through the lens.

If the camera needs to be placed in the sunshine, throw

to make the exposure. Led, *Photography*, p. 44.

2. A metallic substance formed into very thin sheets by rolling and hammering; as, gold, tin, or lead foil. Gold foil is beaten out to the utmost tenuity. Tin foil has a slight alloy of copper, lead, etc. Dutch foil is made by rolling a plate of copper coated with silver into thin sheets, polishing the silver surface, varnishing it, and then laying on a coat of transparent color mixed with linings. A variegated Japanese foil is made by combining thin sheets of different metals in a single plate, which is so treated that the different metals or alloys show in the completed sheet like the lines or figures on a Damascus blade. These sheets are extremely flexible, and can be stamped, engraved, etc., for decorative use.

Whom walls were high, but nothing stronger nor thick,
And golden foils all over them displayed.

3. In jewelry, a thin leaf of metal placed under a precious stone to change its color, or to give it more color in case of its being inferior in that respect, or to give it additional luster by the reflection of light from the surface of the metal. Much old jewelry is made with thin and poor stones, to which effect is given by this means.

The stone had need to be rich that is set without foil.

So diamonds owe a lustre to their foil. Pope.

4. Leaf-metal placed behind translucent enamel for the same purpose as that used for precious stones. (See def. 3.) In this sense often called *paillon* (which see). Hence—5. Anything of a different color or of different qualities which serves to adorn or set off another thing to advantage; that which, by comparison or contrast, sets off or shows more conspicuously the superiority of something else.

This brilliant is so spotless and so bright,
He needs no foil, but shines by his own proper light.

foill³ (foil), n. [Prob. < foill², v. 2, in the lit. sense 'blunt'; but examples of this sense are wanting.] A bated or blunted sword used in fencing-practice and friendly contests; now, usually, an implement used in fencing-schools, for small-sword practice only. It has a blade of small quadrangular section, a button on the point, and for the guard two open lunettes or loops which it is common to reinforce by 'shells' of thick leather. The French fencing masters and amateurs distinguish between the *decent* or light foil and the *épée de combat*, which is like the dueling-sword or *épée de combat*, except in having a buttoned point, and is therefore much heavier than the *decent*. See *fleur-de-lis*.
